SAMPLE

This is a real AS Paper 2 I marked for a student, shown as they got it back, in their own handwriting. The only change is that their name is removed. Every mark and note is what they received.

YOUR OWN PAPER

Want yours marked like this? It's from £25 a paper at **cieinsider.com/marked**. The last page explains how it works.

Here's your Paper 2.

9702/23, October/November 2024 (Paper 2, Variant 3). Marked against Cambridge's published mark scheme for that paper, the way I marked scripts for Cambridge.

47 / 60
YOUR MARK

44 / 60
WORST CASE

Q1	Q2	Q3	Q4	Q5	Q6	Q7
6/7	11/11	7/9	3/7	6/8	10/10	4/8

That's an A on this paper: the A line for 9702/23 in that series was 47 out of 60. Worst case: if your examiner was having a bad day, the three marks I gave you on the benefit of the doubt could go the other way, and 47 becomes 44, a B. You're exactly on the A line, so the green cards on page 3, which make those three marks safe, matter as much as the marks you lost. Your calculations are the strength. Every one of them scored full marks except 4(b)(i), and there the arithmetic was right too. Almost everything you lost was in drawings and in recall.

The one thing I'd fix before your next Paper 2

When a question asks you to sketch or mark something, work the physics out first, then draw it. Three drawing parts cost you 4 marks, on a paper where you could calculate everything:

- **1(b)(i)**: two parts later you worked out that the parcel lands with 35 m/s down and 42 m/s across. That's about 40 degrees below the horizontal, so the path can't end nearly vertical. (note 1)
- **3(c)**: the end point can be calculated. x is zero when the upthrust holds up the whole 4.0 N, at h = 0.29 m. (note 3)
- **5(b)(ii)**: follow the source round the circle before you draw anything. (note 7)

The second thing is quicker: **learn the quark charges**. 7(a) was 3 marks of recall, and every entry was wrong. (note 8) The third is the unit: **quote the unit even when you're copying the value from the question**. That cost 4(b)(ii) a mark. (note 6)

Where the other marks went

The blue numbers match the blue circles on your script.

1 **1(b)(i)** 1 MARK

You did the hard part: your path starts horizontally from the bottom of the aircraft. But there's no air resistance, so the horizontal velocity stays 42 m/s all the way down. The path never turns vertical. Your own answers to (iii) and (iv) give the landing direction: $\tan^{-1}(35/42)$ is about **40 degrees** below the horizontal. Your curve finishes at nearly 80 degrees.

> EXAMINER REPORT, NOV 2024
> "Many candidates gave a parabola with a vertical final section even though the question stated that there was no air resistance."

2 **3(a)** 1 MARK

Leave out "dynamic". The principle of moments applies to any body in equilibrium, and the beam in this question isn't moving. Write: **for a body in equilibrium, the sum of the clockwise moments about a point equals the sum of the anticlockwise moments about the same point.**

SAMPLE | A real script marked by Rich, in the student's own handwriting. Name removed. | Get yours marked at cieinsider.com/marked

3 **3(c)** 1 MARK

The start point and the straight line with a negative gradient both scored. The end point is nearly a full small square too far to the right: your line reaches x = 0 at about h = 0.295 m, and it needs to finish at 0.29 m. You can calculate it. When x = 0 the load has no moment, so the upthrust carries the whole 4.0 N. The upthrust is proportional to h (1.4 N at 0.10 m), so h = 0.10 × 4.0/1.4 = **0.29 m** (0.286 before rounding). Draw the line to that point on the axis.

4 **4(a)(i)** 1 MARK

Stress is force per unit **cross-sectional** area. Without "cross-sectional" the mark isn't given.

> EXAMINER REPORT, NOV 2024
> "Many candidates were not specific and did not state that the force needed to be applied on the cross-sectional area."

5 **4(b)(i)** 2 MARKS

The load hangs halfway between the two wires, so each wire carries half of it: **9.0 N**, not 18 N. Then A = (9.0 x 0.84)/(1.9 × 10^9 x 0.47 × 10^{-3}) = **8.5 × 10^{-6} m^2**. Your equation and your arithmetic were both right.

> EXAMINER REPORT, NOV 2024
> "Many candidates used the full load for the force causing the extension of wire X, instead of only half the value of the load."

6 **4(b)(ii)** 1 MARK

Naming the force, the length and the extension scored the first mark. The second mark is for the conclusion about wire Y, and it's lost on two points. You never say that Y has the **greater cross-sectional area**, and "less than 1.9 × 10^9" has **no unit**. The unit is part of the answer even when the number is copied from the question: **1.9 × 10^9 Pa**. A sentence that scores both: **F, L and x are the same for both wires. Wire Y has the greater cross-sectional area, and E = FL/Ax, so the Young modulus of Y is less than 1.9 × 10^9 Pa.**

7 **5(b)(ii)** 2 MARKS

Follow the source round once. At t = 0 it's moving across the observer's line of sight, so the observer hears **780 Hz**. Over the top of the circle it moves away, so the frequency **falls to a minimum** (about 695 Hz). At the far side it's moving across again: back to 780 Hz. Along the bottom it moves towards the observer, so it **rises to the maximum** (your 890 Hz). It finishes back at 780 Hz. That's one smooth wave: start in the middle, down, up, back to the middle. A step can't be right, because the speed along the line of sight changes smoothly.

> EXAMINER REPORT, NOV 2024
> "The majority drew graphs that showed a variation for half a rotation only and many were an incorrect shape."

8 **7(a)** 3 MARKS

The charges are **up +2/3, down -1/3, strange -1/3**. Each antiquark has the opposite sign: **anti-up -2/3, anti-down +1/3, anti-strange +1/3**. You swapped the 1/3s and 2/3s, and gave the anti-up the same sign as the up. A quick check: a proton is uud, so +2/3 +2/3 -1/3 = +1.

9 **7(c)** 1 MARK

Up quark to down quark scored. The second mark is for naming both particles emitted: a **positron** and an electron neutrino. You named the neutrino in words, but the positron only appears as a symbol in your equation, and "describe" needs the name. Your equation is right, by the way.

> EXAMINER REPORT, NOV 2024
> "The positron was rarely named as a fundamental particle emitted with a neutrino."

SAMPLE | A real script marked by Rich, in the student's own handwriting. Name removed. | Get yours marked at cieinsider.com/marked

Marks you got, but I'd tighten the wording

These all scored. Three were marked generously (BOD), and the others are habits worth fixing. Don't give an examiner any excuse to take a mark away. They mark hundreds of scripts and won't puzzle over yours, so make every step visible. You don't need full sentences: step-by-step maths, with a few words to signpost each step, is clearer and quicker.

Show-that questions need this most. The answer is printed in the question, so no mark is ever for the final answer. Every mark is for a step, and a step you skip or leave the examiner to guess is a mark at risk.

A **3(b)(i)**

Full marks, and the same route as the mark scheme. Two things to tighten. F appears from nowhere, so the examiner has to work out what it is: say what it stands for. And the question asks you to show that the upthrust **U** is 1.4 N, so write **"U ="** on the last line. You wrote "4.0 - 2.6 N = 1.4 N", leaving the examiner to decide it's U. One step per line:

> F = tension in the string holding the cylinder
> Moments about the pivot: 2.6 × 0.40 = F x 0.40
> F = 2.6 N
> U = 4.0 - F = 4.0 - 2.6 = 1.4 N

B **5(a)(i)** BOD

Your antinode cross is in exactly the right place along the string, so it scored. But it sits on the dashed line, not on the wave. An antinode is where the string moves furthest, so put the cross **on the peak or the trough**, where the string is at that instant.

C **5(a)(ii)** BOD

This is a show-that, and it says "explain your reasoning", so the one mark is for the reasoning, not the 0.32 m. "3/2 lambda = 0.48" starts at the answer to the reasoning: the examiner has to go back to the diagram to see where the 3/2 came from. I gave it, but another examiner might not. You don't need sentences, just that first step, signposted:

> XY = 3 node-to-node gaps = 3 x lambda/2
> 3 x lambda/2 = 0.48 m
> lambda = 0.48 × 2/3 = 0.32 m

D **6(a)**

"Voltage" scored, but the wording to use is **potential difference per unit current**. Never write a unit ("volt per amp"): a definition is in terms of quantities.

E **6(c)(ii)** BOD

Your conclusion is right, but P is not proportional to I. For the wire, R is fixed, so $\mathbf{P = I^2R}$ and P is proportional to I^2. Write the relationship you actually mean:

> As the temperature rises, the thermistor's resistance decreases, so the total resistance decreases and the current increases. The wire's resistance is fixed, so the power in it, $P = I^2R$, increases.

Reading the marks on your script

✓ Mark awarded, placed where you earned it	✓ In a calculation, all the ticks go by the final answer	✗ Not awarded
∧ Something the mark needed is missing here	2/2 Your mark for that part	BOD Marked generously. See the green cards for the safer wording

Good luck with the real one.
Rich

Cambridge International AS & A Level

CANDIDATE NAME

CENTRE NUMBER

CANDIDATE NUMBER

6377769737 8

PHYSICS **9702/23**

Paper 2 AS Level Structured Questions **October/November 2024**

1 hour 15 minutes

You must answer on the question paper.

No additional materials are needed.

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

INFORMATION

- The total mark for this paper is 60.
- The number of marks for each question or part question is shown in brackets [ ].

This document has **16** pages. Any blank pages are indicated.

(c) The wire in **(b)** may be considered to be a fixed resistor. It is connected in series with a thermistor to a battery that has negligible internal resistance.

(i) Use circuit symbols to complete Fig. 6.1 to show the circuit diagram of this arrangement.

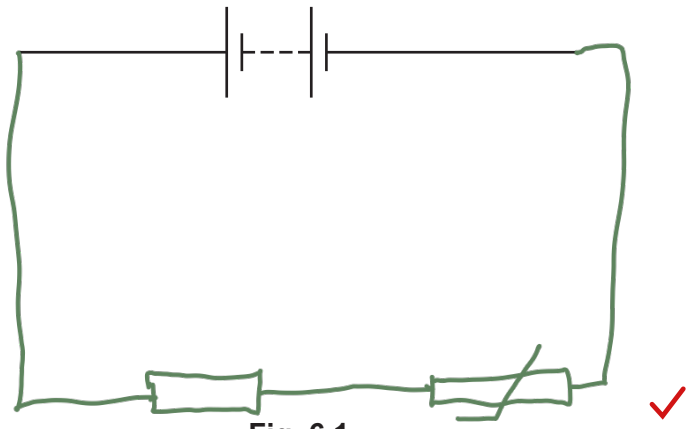

Fig. 6.1

[1] 1/1

(ii) Explain, without calculation, how the power dissipated in the wire changes as the temperature of the thermistor is increased.

- increasing temperature of thermistor decreases its resistance ✓
- current in circuit increases
- $P \propto I$ so, power dissipated in the wire increases ✓ BOD

..... [2] 2/2

SAMPLE | A real script marked by Rich, in the student's own handwriting. Name removed. | Get yours marked at cieinsider.com/marked

7 **(a)** Complete Table 7.1 to show the charges, in terms of the elementary charge *e*, on each of the flavours of quark and antiquark shown.

Table 7.1

flavour	charge / *e*	
	quark	antiquark
up	$+\frac{1}{3}$ ✗	$+\frac{1}{3}$
down	$-\frac{2}{3}$	$+\frac{2}{3}$ ✗ 8
strange	$-\frac{2}{3}$ ✗	$+\frac{2}{3}$

0/3

[3]

(b) **(i)** State the name of the class (group) of fundamental particles to which baryons and mesons belong.

Hadrons ✓ 1/1

..... [1]

(ii) Compare baryons and mesons in terms of their constituent particles.

- Baryons have 3 quarks ✓
- mesons have 1 quark and 1 antiquark ✓

2/2

..... [2]

(c) Describe β^+ decay in terms of the fundamental particles involved.

- a proton turns into a neutron because an up quark changes to a down quark ✓
- and an electron neutrino is also released ^ 9

1/2

..... [2]

$^{210}_{16}X \longrightarrow {}^{210}_{25}Y + {}^{0}_{1}\beta^{+} + \nu$

CIE INSIDER | GET YOUR OWN PAPER MARKED

Want yours marked like this?

Everything before this page is a real script I marked for a student. I marked A Level Physics (9702) and IGCSE Physics (0625) for Cambridge, and your paper gets marked the same way.

What comes back

- Your paper marked against the published mark scheme, with every mark placed where it was earned or lost.
- For every lost mark: the words that cost it, what the scheme needed instead, and the physics worked through to the right answer.
- The patterns across the whole paper, and the one thing I'd fix first.

How it works

1. Sit a full 0625 or 9702 past paper, timed, in one go. Keep your working as you wrote it: photos of your handwriting are fine.
2. Go to **cieinsider.com/marked**, pick your paper and pay. It's from £25 a paper, and every price is on that page.
3. Email your paper to **rich@cieinsider.com** with the subject "Marked script", from the address you paid with.
4. It comes back within a week, usually sooner. If it takes longer, ask and I'll refund you, and you keep the marking.

Not sure which paper you sit? Email me at **rich@cieinsider.com** before you pay and I'll tell you.

Rich
